Shown That Stars And Gas Orbiting Near The Centres

Of Galaxies Are Being Accelerated To Very High Orbital Velocities. This Can Be Explained If A Large Supermassive Object With A Strong Gravitational Field In A Small Region Of Space Is Attracting Them. The Most Likely Candidate Is A Supermassive Black Hole.

Fig. 2 Illustrates The Falsity Of The Naïve Assumption That Dark Energy Is Only Important At Low Redshift: Dark Energy Has An Influence, Significant On The Precision Scales SNAP Can Achieve, Out Beyond $Z = 1.5$.
