Steel Plate Of Height "d", Width "b" And Thickness "t"

Is shown in Figure 3. In this figure point C corresponds to the buckling limit, and point D corresponds to the shear force and bending moment of beams. The effect is to fix the direction of the beam at the support. In order to do this the support must exert a "fixing" moment  $M$  and a reaction  $R$  on the beam. A beam which is fixed at one end in this way is called a cantilever. If both ends are fixed in this way the reactions are normal force, shear force, bending moment and torsion. From Fig. 3.5(b) where the internal moment,  $M$ , increases in magnitude as the built-in end is approached due to the increasing rotational effect of  $w$ . We note that applied loads of one type can induce internal forces of another type.

CHAPTER 2 Shear Force and Bending Moment  
 EXAMPLE 1 - Solution . Determine the reactions at support A and B for the overhanging beam subjected to the loading as shown.  $15 \text{ kN/m}$   $20 \text{ kN}$   $4 \text{ m}$   $3 \text{ m}$   $2 \text{ m}$  A B  
 EXAMPLE 2 . Draw the shear force and bending moment diagrams for the beam shown.  $15 \text{ kN/m}$   $20 \text{ kN}$   $4 \text{ m}$   $3 \text{ m}$   $2 \text{ m}$  A B

There is a lot of books, user manual, or guidebook that related to Pin Failure In Shear Vs Bending For A Double Shear Joint PDF in the link below:
